

YERNAR IBADULLA

Junior+ AI Integration / Full-Stack Developer

Astana, Kazakhstan | +7 775 417 1880 | yernaribadulla@gmail.com | github.com/Yernaribadulla

SUMMARY

Junior+ software developer specializing in AI-powered business automation, workflow integrations, and web applications. Proficient in Python, JavaScript, REST APIs, and LLM integrations. Practical commercial and project-based experience in deploying AI assistants, multi-step automated workflows via n8n and Make, and building data-driven QR-analytics and job-automation platforms for real businesses and personal use.

TECHNICAL SKILLS

- Languages: Python, JavaScript
- Backend & Web: Node.js, REST APIs, Webhooks, HTML5, CSS3
- AI & Automation: LLM Integration, Prompt Engineering, Function Calling, n8n, Make, NextBot
- Browser Automation: Playwright
- Tools & Hosting: Git, GitHub, Linux, GitHub Pages
- Integrations: amoCRM API, Google Calendar API, Google Sheets API, Kaspi API, Robokassa API

COMMERCIAL EXPERIENCE

S-Dental | AI Automation Developer

- Developed and deployed an AI assistant to automate client communication, equipped with a knowledge base regarding clinic services and pricing.
- Implemented automated appointment scheduling, rescheduling, and cancellations via Function Calling, integrating Google Calendar and amoCRM for seamless client data synchronization.
- Configured automated payment workflows via Kaspi API and established robust logic between the AI assistant, CRM, and calendar systems using NextBot, Make, and n8n.

Coffee Shop Analytics Platform («Shtil») | AI Automation / Full-Stack Developer

- Architected and maintained a web-based analytics and QR-feedback system for a local coffee shop to track customer satisfaction and employee performance.
- Implemented individualized QR-tracking for baristas with automated conversion rate calculations (tracking ratio of QR scans to submitted reviews) and customer routing to external platforms (2GIS, Yandex, Instagram).
- Developed an interactive administrative dashboard utilizing Google Sheets as a lightweight backend via GViz API / JSON, with dynamic data parsing and review filters.
- Built and deployed the client-facing QR-feedback interfaces using vanilla JavaScript, HTML5, and CSS3, hosted on GitHub Pages.

PROJECTS

AI-Powered Job Application & Parsing Agent

- Designed and built a multi-module Python backend (apply.py, config.py, candidate.py, filter.py, hh_api.py, main.py — 3,700+ lines total) that scrapes job postings via Playwright, evaluates each vacancy against a candidate profile using a fully local LLM (LM Studio, run on personal hardware), and auto-submits tailored applications.

- Designed a structured scoring system (role fit, skill fit, seniority fit) with a rule-based safety filter layered on top of LLM output to prevent false-positive “hard blocker” rejections and enforce consistent apply thresholds for standard vs. remote roles.
- Implemented JSON-based response parsing with error recovery, deduplication against previously applied vacancies via a local log, and automatic cover-letter language detection based on the vacancy's description language.
- Automated the full browser flow — session persistence, form detection, cover-letter injection, and submission confirmation — using Playwright.

EDUCATION

Turan-Astana University

- Faculty of Information Technologies and Cybersecurity
- Government Educational Grant

LANGUAGES

- Kazakh: Native / Fluent
- Russian: Fluent
- English: B2+ (IELTS Academic 6.5 — Official)
